

Table 2. Studies with SLE patients

Authors & Reference	N	Gender	Country	Age (years)	BMI (kg/m ²)	Disease duration	SLEDAI	Sequencing	α and β-diversity	F/B ratio	Phylum	Class	Order	Family	Genera	Species	Up-regulated functional pathways	Main findings
Guo et al. [26]	17 SLE patients without glucocorticoid therapy (SLE G-) 20 SLE patients with glucocorticoid therapy (SLE G+) 20 HC	Female	China	SLE G-: 34.41 ± 3.404 SLE G+: 34.25 ± 2.945 HC: 30.35 ± 1.907 (mean ± SEM)	SLE G-: 22.41 ± 0.4314 SLE G+: 23.14 ± 0.763 HC: 22.53 ± 0.686 (mean ± SEM)	SLE G-: 15.74 ± 5.984 SLE G+: 47.75 ± 8.039 Months (mean ± SEM)	SLEDAI < 6 SLE G+ (n = 10) SLE G- (n = 9) SLEDAI ≥ 6 SLE G+ (n = 10) SLE G- (n = 8)	16S rRNA: V4 regions Illumina Hiseq	SLE G-: lower α-diversity. HC and SLE G+: similar microbial communities, and bacteria abundance. No differences in α-diversity, community structure, or abundance of top 10 genera between SLEDAI < 6 vs. SLEDAI ≥ 6.	SLE G-: lower than HC.	SLE G-: <i>Bacteroidetes</i> and <i>Proteobacteria</i> significantly increased vs. HC and SLE G+. Decreased <i>Verrucomicrobia</i> , <i>Firmicutes</i> , and <i>Proteobacteria</i> .	NA	NA	NA	SLE G- vs. HC: increased <i>B.</i> , <i>Parabacteroides</i> SLE G+ vs. SLE G- and HC: increased <i>Akkermansia</i> and <i>Lactobacillus</i>	NA	SLE G- vs. SLE G+ and HC: citrate cycle Glycolysis/Gluconeogenesis, Fructose and mannose metabolism, Galactose metabolism, other glycan degradation, MAPK signaling Glycosaminoglycan degradation, and Glycerophospholipid metabolism, and Pentose phosphate. SLE G+: ABC transporters, Amino acid metabolism, Bacterial motility proteins, Bacterial secretion system, fatty acid metabolism, Lipid metabolism, Glycan biosynthesis and metabolism, and Phosphotransferase system.	Glucocorticoid therapy has the potential to stabilize the gut microbiota of SLE patients, further decreasing the production of cytokines.
He et al. [27]	45 SLE patients 48 HC	Female	China	SLE: Train: 46.0 ± 1.8 (25, 61) Test: 39.9 ± 4.3 (18, 62)	SLE: Train: 21.5 ± 0.6 (16.4, 28.8)	SLE: Train: 7.9 ± 1.2 [1, 28] Test: 5.0 ± 1.6 [1, 16]	SLE: Train: 7.5 ± 0.5 [3, 14] Test: 6.7 ± 0.8 [4, 10]	16S rRNA: V3-V4 regions Illumina Miseq	α-diversity: no significant differences between SLE and HC.	NA	SLE: increased <i>Bacteroidetes</i> , <i>Actinobacteria</i> , and <i>Proteobacteria</i> ;	NA	NA	SLE: increased <i>Prevotellaceae</i> .	SLE: increased <i>Rhodococcus</i> , <i>Eggerthella</i> , <i>Klebsiella</i> , <i>Prevotella</i> , <i>Eubacterium</i> ,	NA	NA	Significantly altered genera could have the ability to discriminate

				<p>HC: Test: 21.2 ± 1.2 (18.3, 27.7)</p> <p>Train: 43.5 ± 2.4 (22, 68)</p> <p>Test: 42.7 ± 1.9 (20, 56)</p> <p>[mean ± SD (min, max)]</p>	<p>Test: 21.6 ± 0.2 (20.6, 25.8)</p> <p>[mean ± SD (min, max)]</p>	<p>[mean ± SD (min, max)]</p>	<p>[mean ± SD (min, max)]</p>	<p>β-diversity: difference between SLE and HC.</p>	<p>decreased <i>Firmicutes</i>.</p>				<p><i>Flavonifractor</i>, and <i>Incertae sedis</i>.</p> <p>Decreased <i>Dialister</i> and <i>Pseudobutyrvibrio</i>.</p>			<p>between SLE patients and HC.</p>

Chen et al. [41]	117 newly diagnosed SLE patients 115 HC	SLE Female: 107 Male: 10 (9%) HC Female: 97 Male: 18 (16%)	China	SLE: 30.8 ± 10.9 HC: 32.4 ± 11.3 (mean ± SD)	SLE: 20.8 ± 3.1 HC: 22.2 ± 3.0 (mean ± SD)	4 (mean) Months	10 (mean)	Metagenomic shotgun sequencing Illumina HiSeq	α-diversity: lower in SLE than HC (Shannon Index).	NA	NA	NA	NA	NA	NA	NA	Enriched in SLE patients and reduced after treatment: <i>Clostridium</i> sp. ATCC BAA-442, <i>Atopobium rima</i> , <i>Shuttleworthia satelles</i> , <i>Actinomyces massiliensis</i> , <i>B. fragilis</i> , <i>Clostridium leptum</i> , and an unclassified <i>Escherichia</i> .	Positively related to lupus: biosynthesis of <i>L</i> -arginine and <i>L</i> -ornithine, tryptophan, menaquinol, palmitoleate and oleate, phosphatidylglycerol biosynthesis, as well as purine nucleotides salvage and degradation. Negatively related to lupus: peptidoglycan biosynthesis and BCAAs biosynthesis.	<i>Clostridium</i> sp. ATCC BAA-442 positively correlated with SLEDAI. <i>Lactobacillus salivarius</i> positively correlated with SLEDAI and disease duration. <i>R. gnavus</i> was enriched in LN. In SLE patients but not in HC, the oral microbiota may contribute to gut inflammation and autoimmune pathology development.

																16770, CIP 107999 and AHN 2437).		
Hevia et al. [34]	20 SLE patients 20 HC	SLE Female: 20 HC Female: 20	Spain	SLE: 49.2 ± 10.7 HC: 46.9 ± 8.6 (mean ± SD)	SLE: 26.1 ± 5.3 HC: 25.2 ± 4.2 (mean ± SD)	2 years to 24 years	SLEDAI ≤ 8 vs. SLEDAI > 8	16S rRNA: V3 region Ion Torrent PGM	α-diversity: no difference (Shannon index).	SLE: lower.	SLE: increased relative abundance of <i>Bacteroidetes</i> .	SLE: increased <i>Bacteroidi</i> a.	<i>Bacteroid</i> ales and <i>Clostridial</i> es: significant difference between SLE and HC.	NA	SLE: high <i>Bacteroidetes</i> spp.	NA	SLE: glycan degradation pathways, lipopolysaccharide biosynthesis proteins, oxidative phosphorylation.	SLE patients had lower <i>F/B</i> ratio. Positive association between <i>Firmicutes</i> and HC and <i>Bacteroidetes</i> and SLE patients.

Tomofuji et al. [35]	47 SLE patients 203 HC	SLE Female: 43 Male: 4 (9%) HC Female: 104 Male: 99 (49%)	Japan	SLE: 42.9±15.9 HC: 35.4±12.0 (mean ± SD)	NA	Newly diagnosed: 18 (38.3%) Not newly diagnosed: 29 (61.7%)	Mean: 11.1±8.7	Whole-genome shotgun sequencing.	α-diversity: lower in SLE vs. HC; not different between the newly onset patients vs. other patients, patients with and without LN, or patients with high and low SLEDAI. β-diversity: altered in SLE vs. HC; not different between the newly onset patients vs. other patients, patients with and without LN, or patients with high and low SLEDAI.	NA	NA	NA	NA	NA	NA	SLE: increased <i>Streptococcus</i> <i>anginosus</i> and <i>Streptococcus</i> <i>intermedius</i> .	SLE: sulfur metabolism, redox reaction, flagellar assembly, starch and sucrose metabolism, cyanoamino acid metabolism, energy metabolism, ABC transporter, cell motility.	Altered gut microbiota in SLE vs. HC. Eight genes increased in the SLE metagenome derived from <i>Streptococcus</i> , including a gene related to redox reaction. SLE-specific link between biological pathways of the gut microbiota and the host genome.
He et al. [36]	21 SLE patients 10 HC	SLE Female: 21 HC Female: 10	China	SLE: 37.48 ± 2.44 HC: 37.50 ± 3.02 (mean ± SD)	NA	NA	NA	16S rRNA: V3–V4 regions Illumina HiSeq	α-diversity: no difference (Shannon, Simpson, Chao1 indexes). β-diversity: altered between SLE and HC.	SLE: increased.	SLE: increased <i>Bacteroidetes</i> , <i>Proteobacteria</i> .	SLE: decrease d <i>Bacteroidi</i> a, Clostridia; increased <i>Gammapr</i>	SLE: decrease d Bacteridal es, Clostridal es;	SLE: increased <i>Enterobacteriac</i> <i>eae</i> , <i>Enterococcacea</i> e; decreased <i>Ruminococcace</i> ae.	SLE: decreased <i>Bacteroidetes</i> , <i>R_2</i> and <i>R. UCG-002</i> , <i>Faecalibacterium</i> ; increased <i>Proteobacteria</i> , <i>Enterococcus</i> , <i>Escherichia_Shigella</i> .	NA	NA	The gut microbiome of SLE patients displayed altered β- diversity. ~ 1-fold increase in the

											<i>oteobacteria</i> .	increased Enterobacteriales.					<i>F/B</i> ratio in SLE patients. Dysbiosis, including the decrease of potentially beneficial <i>Bacteroidetes</i> and the increase of the potentially pathological <i>Proteobacteria</i> , may contribute to SLE pathogenesis.
Azzouz et al. [37]	61 SLE patients 17 HC	SLE Female: 61 HC Female: 17	United States of America	Between 20 and 79	NA	NA	SLEDAI < 8 (<i>n</i> = 47) SLEDAI ≥ 8 (<i>n</i> = 14)	16S rRNA: V4 region Illumina MiSeq	α-diversity: lower in SLE than HC; a numerical trend towards an inverse correlation with SLEDAI; high disease activity (SLEDAI ≥ 8) lower diversity vs. HC. (Chao1 index). β-diversity: altered in SLE vs. HC; less variability in patients	NA	NA	NA	NA	SLE: <i>Veillonellaceae</i> , <i>Ruminococcaceae</i> .	SLE: <i>R.</i> <i>B. uniformis</i> : lower in patients with highest disease activity.	NA	SLE patients with LN have intestinal expansions of the <i>R. gnavus</i> . The overabundance of <i>R. gnavus</i> correlated with lupus disease activity, and it was higher in patients with

									with low vs. high disease activity.								active renal disease. SLE patients with the highest disease activity had the lowest abundance of <i>B. uniformis</i> .	
van der Meulen et al. [38]	35 SLE patients 40 pSS patients 965 HC	SLE Female: 33 Male: 2 HC Female: 554 Male: 408 (42%)	Netherlands	SLE: 47 ± 14 HC: 45 ± 13 (mean ± SD)	SLE: 27 ± 5 HC: 25 ± 4 (mean ± SD)	SLE: 11 ± 9 (mean ± SD)	SLEDAI ≤ 4 vs. SLEDAI > 4	16S rRNA: V4 region Illumina MiSeq-v2	α-diversity: lower richness in SLE than HC (Chao1); without differences in diversity (Shannon index). β-diversity: altered in SLE vs. HC; different β-diversity between high or low disease activity.	SLE: lower	SLE: higher <i>Bacteroidetes</i> and <i>Proteobacteria</i> .	NA	NA	NA	SLE: higher <i>B.</i> , and <i>Alistipes</i> . Genera associated with SLE: <i>Butyrivibrio</i> , <i>Dorea</i> , <i>Erysipelotrichaceae</i> -UCG-003, <i>Eubacterium ruminantium</i> group, <i>Marvinbryantia</i> , <i>Phascolarctobacterium</i> , <i>Ruminoclostridium_9</i> , <i>R. gaurvreauii</i> group.	SLE: higher <i>B. vulgatus</i> , <i>B. uniformis</i> , <i>B. ovatus</i> , and <i>B. thetaiotaomicron</i> .	NA	Factors contributing to the microbiota variation: age, sex, BMI, smoking, and use of PPI. Lower richness of the gut microbiota of SLE patients than HC.
Li et al. [39]	40 SLE patients (20 receiving PPI: P-SLE and 20 not receiving: NP-SLE)	SLE Female: 40 HC	China	P-SLE: 34.25 ± 10.54 NP-SLE:	P-SLE: 22.49 ± 3.39 NP-SLE: 23.16 ± 2.78	P-SLE: 1.5 (0.15–4.7) NP-SLE: 5.5 (0.7–10.75)	P-SLE: 9.65 ± 4.78 NP-SLE: 6.5 ± 4.51 (mean ± SD)	16S rRNA: V3–V4 regions Illumina	α-diversity: lower in NP-SLE vs. HC; P-SLE with higher diversity than NP-SLE.	NA	Higher Veillonellaceae and Enterobacteriaceae in NP-SLE than P-SLE and HC.	NA	NA	Higher abundance of Enterobacteriaceae in NP-SLE	NP-SLE: higher <i>Rothia</i> , <i>Morganella</i> , <i>Escherichia</i> , <i>Pseudomonas</i> , <i>Stenotrophomonas</i> ,	NA	Increased in P-SLE and NP-SLE: carbon fixation pathways in prokaryotes, cell growth and death, thiamine metabolism, immune system,	SLE patients using PPI showed different gut microbiota than

	SLE) 17 HC	Female: 17		35.95 ± 10.27 HC: 30.12 ± 14.14 (mean ± SD)	HC: 22.48 ± 2.51 (mean ± SD)	(Years, median (IQR))			(Chao1, inverse Gini- Simpson, Shannon index) β-diversity: higher variation within NP- SLE vs. HC and P- SLE.		Lower Prevotellaceae in NP-SLE than HC. Without statistical significance between groups.			than P-SLE and HC. Veillonella, and Enterococcus than HC. P-SLE: higher Desulfovibrio, Oxalobacter, Roseburia, Streptococcus, and <i>Lactobacillus</i> than NP- SLE. Lower Veillonella, Escherichia, Pseudomonas, Stenotrophomonas, and Morganella were lower than NP-SLE.	DNA replication, drug metabolism, other enzymes, NOD-like receptor signaling pathway, and plant-pathogen interaction. Reduced in P-SLE: nitrotoluene degradation, biofilm formation by Escherichia coli, propanoate metabolism, pentose phosphate pathway, phosphotransferase system PTS, ABC transporters, membrane transport, and environmental information.	patients not taking it. Characteristics of the gut microbiota of P-SLE patients similar to HC. PPI use was associated with altered microbial metabolic pathways in SLE and improved the microbiota composition of SLE patients.	
Ma et al. [40]	18 SLE patients 7 HC	SLE Female: 18 HC Female: 7	China	NA	NA	NA	NA	16S rRNA: V4 region IonS5 XL	α-diversity: no differences. β-diversity: differences not statistically significant.	NA	NA	NA	NA	NA	SLE: increased <i>Clostridium</i> <i>papyrosolve</i> <i>ns</i> , <i>Lactobacillus</i> <i>reuteri</i> , <i>Lactobacillus</i> <i>intestinalis</i> , <i>Lachnospira</i> <i>ceae</i>	NA	Fecal transplant from SLE patients to germ-free mice led to an increase in autoantibodies, and an approximation of the gut microbiota

																	<i>bacterium</i> A2 and <i>Lachnospira</i> ceae <i>bacterium</i> M18-1.	composition between donors and recipients. Fecal microbiota from SLE patients can induce lupus- like phenotypes and alter histidine metabolism in germ-free mice.
